EFFECTIVE AND EFFICIENT USE OF NCBI/PUBMED

- TOOLS TO HELP YOU DO WHAT YOU NEED TO DO -

This presentation has been designed for Nursing and Health Sciences educators who:

- develop and teach courses and labs
- coordinate and run journal clubs and seminars
- counsel/mentor students
- and stay current on everything related to clinical practice, teaching, and research
- work in the clinic
- publish in scientific/clinical journals
- perform research and write grants

NCBI has resources that would help most of these efforts,
but there is so much information available and so little time to find and organize it.

Sign up for a free NCBI Account and let us help you do what you need to do!

This an interactive workshop will show you how to:

- create effective searches - *a quick review, plus some tips & tricks*
- utilize filters & create your own custom filters - *quickly narrow down search results and speed up finding relevant information*
- customize your search results display - *dramatically speed up your finding of stuff (critical for clinical environments)*
- save searches and get automated updates - *be notified when new publications or database records are available*
- maintain custom collections of important records - *support course work, clinic work and research projects*
- create lists of publications or database records - *share a collection with students and colleagues in courses, journal clubs and research teams*
- maintain your bibliography and create a URL to share - *get a URL for your Faculty profile and/or webpage*
- use your NCBI account to help you with NIH Granting!

Some upcoming developments at NCBI will also be discussed....

Presenter: Rana Morris, PhD - an NCBI Customer Experience team member and Team Lead for Educational Programs (Courses/Workshops, Webinars, Educational Materials). Since 2002, she has provided user support and training, as well as working with supervisors and development teams to improve NCBI resources based on user-centered design principles. Her doctoral, post-doctoral and research fellowship work integrated disciplines of computational and experimental biochemistry, molecular and cellular biology and genetics, and has included diagnostic development, drug design and coordination of genetics/genomics components of clinical trials.
